BASELINE METRICS

YOLO Version	Precision	Recall	mAP50	mAP50-95
YOLOv8n	0.9267	0.8851	0.9329	0.8337
YOLOv11n	0.9131	0.8735	0.9189	0.8038
YOLOv26n	0.9370	0.8469	0.9176	0.8283

- The results indicate that YOLOv8n demonstrated the best performance, achieving a Precision of 0.9267, Recall of 0.8851, mAP50 of 0.9329, and mAP50-95 of 0.8337.
- The model also recorded the highest Recall among the three models, signifying its ability to identify a higher number of vehicles in the image.
- In addition, YOLOv8n registered the highest mAP50 and mAP50-95, which also implies superior detection and bounding-box localization.
- YOLOv26n demonstrated the highest Precision of 0.9370, meaning that the model's predictions were the most accurate among the three models.
- However, the model had the worst Recall of 0.8469, indicating that the model failed to detect some of the vehicles that the other two models identified.
- YOLOv11n had a Precision of 0.9131, Recall of 0.8735, mAP50 of 0.9189, and mAP50-95 of 0.8038.
- Although the model had a relatively good performance, it had the worst mAP50-95 among the three models.
- Therefore, based on this analysis, one can conclude that **YOLOv8n showed the best overall performance**, while YOLOv26n had the highest Precision.
- The results presented above will serve as baseline accuracy metrics to evaluate the performance of different scaling and zoom augmentation levels.
